PROJECT DESCRIPTION

The Korea Information Society Development Institute is a government-affiliated institute established in 1985, with an aim of developing the communications environment by building infrastructure; as well as modernizing the industry in the IT wasteland. By collecting, surveying, and researching a variety of data and information about IT policy and regulations, KISDI has made a great contribution to the establishment of national IT policy and furthermore the development of national economy.

Representing their cutting-edge philosophies, technologies such as Therma-Fuser™ VAV System were applied for HVAC energy efficiency and building sustainability within this new facility.
